Brief Overview

206 Ortho™ is an emerging orthopedic company developing a minimally invasive treatment for the stabilization of bone fractures. Our vision is to help patients with bone fractures get back to full function faster while reducing the cost of treatment.

The company is developing an implant that will stabilize bone fractures in weakened bone. The implant will address the challenge of obtaining and maintaining secure bone fixation. The system is implanted during a minimally invasive surgery to reduce the trauma to surrounding tissue and the cost of treatment.

Current Status with M2D2

206 Ortho is a development stage company. Currently, the company is licensing office space and a R&D lab at the UML M2D2 incubator. In addition, the company employs UMass Lowell students as interns and is working in collaboration with UMass Faculty.

IP Status

U.S. and international patent applications and provisional patents have been filed.
